

Company / Organization Admin

Detailed System Role & Workflow

The Company Admin manages all operations inside a specific transportation or Umrah company.

1. Primary Responsibilities

- Manage company staff and departments
- Monitor operations and fleet performance
- Approve workflows and requests
- Access financial and operational reports
- Manage company buses and drivers
- Control internal permissions

2. Full Operational Flow

The Company Admin acts as the internal owner of the company's operations. Once trips are created by operations teams, the Company Admin monitors approvals, resource allocation, and overall company performance.

This role connects all departments including operations, finance, HR, fleet management, and maintenance.

3. System Interactions

- Interacts with ERP modules
- Interacts with live operational data
- Uses dashboards and reports
- Triggers workflow actions
- Generates system events
- Consumes real-time information
- Affects operational flow and business logic

4. Real-Time Data Impact

This role directly interacts with the real-time transportation ecosystem.

Actions performed by this role can affect:

- Bus operations
- Driver assignments
- Camera monitoring
- GPS tracking
- Financial workflows
- Maintenance workflows
- AI safety alerts
- Passenger information systems

Because the platform is interconnected, actions performed by one role automatically affect other departments and operational flows.

5. Important Developer Considerations

- Role-based access control (RBAC) is critical
- Permissions must be modular and scalable
- Realtime updates are required
- Audit logs should track all actions
- Cross-department workflow integration is necessary
- Dashboard views should differ by role
- Notification systems should be role-aware
- Operational events should be linked across modules

6. Final Assessment

The Company / Organization Admin role is a critical part of the SEUM intelligent transportation ecosystem.

This role interacts not only with traditional ERP workflows, but also with:

- Real-time transportation operations
- AI safety systems
- GPS tracking infrastructure
- Smart bus devices
- Live camera monitoring
- Financial and operational analytics

The system must therefore be designed with interconnected workflows and scalable permission architecture.
