

Customer Service & Booking Staff

Detailed System Role & Workflow

Customer service teams manage bookings, customer communication, schedules, and support.

1. Primary Responsibilities

- Handle customer bookings
- Provide schedule information
- Manage customer communication
- Send WhatsApp notifications
- Handle complaints and support

2. Full Operational Flow

Customer service teams interact with customers through:

- Booking systems
- WhatsApp notifications
- Trip confirmations
- Schedule updates

The system automatically sends:

- Invoice notifications
- Booking confirmations
- Delay alerts
- Operational updates

3. System Interactions

- Interacts with ERP modules
- Interacts with live operational data
- Uses dashboards and reports
- Triggers workflow actions
- Generates system events
- Consumes real-time information
- Affects operational flow and business logic

4. Real-Time Data Impact

This role directly interacts with the real-time transportation ecosystem.

Actions performed by this role can affect:

- Bus operations
- Driver assignments
- Camera monitoring
- GPS tracking
- Financial workflows
- Maintenance workflows
- AI safety alerts
- Passenger information systems

Because the platform is interconnected, actions performed by one role automatically affect other departments and operational flows.

5. Important Developer Considerations

- Role-based access control (RBAC) is critical
- Permissions must be modular and scalable
- Realtime updates are required
- Audit logs should track all actions
- Cross-department workflow integration is necessary
- Dashboard views should differ by role
- Notification systems should be role-aware
- Operational events should be linked across modules

6. Final Assessment

The Customer Service & Booking Staff role is a critical part of the SEUM intelligent transportation ecosystem.

This role interacts not only with traditional ERP workflows, but also with:

- Real-time transportation operations
- AI safety systems
- GPS tracking infrastructure
- Smart bus devices
- Live camera monitoring
- Financial and operational analytics

The system must therefore be designed with interconnected workflows and scalable permission architecture.
