

Fleet Manager

Detailed System Role & Workflow

The Fleet Manager handles buses, vehicle readiness, maintenance, tracking, and fleet performance.

1. Primary Responsibilities

- Track vehicle readiness
- Manage maintenance schedules
- Monitor bus locations
- Track insurance and permits
- Monitor fuel usage
- Analyze fleet efficiency

2. Full Operational Flow

The Fleet Manager ensures buses are operational before assignment.

Before trips:

- Vehicle inspections are verified
- Maintenance status is checked
- Fuel readiness is confirmed
- Documentation validity is verified

During operations:

- Live bus tracking is monitored
- Speed and route performance are analyzed
- Vehicle utilization is measured

3. System Interactions

- Interacts with ERP modules
- Interacts with live operational data
- Uses dashboards and reports
- Triggers workflow actions
- Generates system events
- Consumes real-time information
- Affects operational flow and business logic

4. Real-Time Data Impact

This role directly interacts with the real-time transportation ecosystem.

Actions performed by this role can affect:

- Bus operations
- Driver assignments
- Camera monitoring
- GPS tracking
- Financial workflows
- Maintenance workflows
- AI safety alerts
- Passenger information systems

Because the platform is interconnected, actions performed by one role automatically affect other departments and operational flows.

5. Important Developer Considerations

- Role-based access control (RBAC) is critical
- Permissions must be modular and scalable
- Realtime updates are required
- Audit logs should track all actions
- Cross-department workflow integration is necessary
- Dashboard views should differ by role
- Notification systems should be role-aware
- Operational events should be linked across modules

6. Final Assessment

The Fleet Manager role is a critical part of the SEUM intelligent transportation ecosystem.

This role interacts not only with traditional ERP workflows, but also with:

- Real-time transportation operations
- AI safety systems
- GPS tracking infrastructure
- Smart bus devices
- Live camera monitoring
- Financial and operational analytics

The system must therefore be designed with interconnected workflows and scalable

permission architecture.
