

HR & Driver Management

Detailed System Role & Workflow

HR teams manage employees, attendance, contracts, licenses, and driver evaluations.

1. Primary Responsibilities

- Manage employee records
- Track attendance and leaves
- Handle contracts and licenses
- Evaluate driver performance
- Process HR compliance

2. Full Operational Flow

HR teams manage employee lifecycle operations.

Driver attendance, violations, punctuality, and operational behavior automatically feed into HR evaluations.

The system tracks:

- Licenses
- Expiry dates
- Contracts
- Attendance
- Violations
- Driver scoring

3. System Interactions

- Interacts with ERP modules
- Interacts with live operational data
- Uses dashboards and reports
- Triggers workflow actions
- Generates system events
- Consumes real-time information
- Affects operational flow and business logic

4. Real-Time Data Impact

This role directly interacts with the real-time transportation ecosystem.

Actions performed by this role can affect:

- Bus operations
- Driver assignments
- Camera monitoring
- GPS tracking
- Financial workflows
- Maintenance workflows
- AI safety alerts
- Passenger information systems

Because the platform is interconnected, actions performed by one role automatically affect other departments and operational flows.

5. Important Developer Considerations

- Role-based access control (RBAC) is critical
- Permissions must be modular and scalable
- Realtime updates are required
- Audit logs should track all actions
- Cross-department workflow integration is necessary
- Dashboard views should differ by role
- Notification systems should be role-aware
- Operational events should be linked across modules

6. Final Assessment

The HR & Driver Management role is a critical part of the SEUM intelligent transportation ecosystem.

This role interacts not only with traditional ERP workflows, but also with:

- Real-time transportation operations
- AI safety systems
- GPS tracking infrastructure
- Smart bus devices
- Live camera monitoring
- Financial and operational analytics

The system must therefore be designed with interconnected workflows and scalable permission architecture.
