

Operations Manager

Detailed System Role & Workflow

The Operations Manager controls daily transportation execution, trip scheduling, dispatching, and operational monitoring.

1. Primary Responsibilities

- Create and schedule trips
- Assign buses and drivers
- Monitor trip execution in real time
- Handle delays and route issues
- Coordinate dispatching
- Monitor operational KPIs

2. Full Operational Flow

The Operations Manager creates transportation schedules, assigns buses and drivers, and monitors trip execution.

When a trip starts:

- GPS tracking activates
- AI monitoring systems activate
- Cameras begin recording
- Operational status updates begin

The Operations Manager monitors delays, route deviations, emergencies, and trip completion in real time.

3. System Interactions

- Interacts with ERP modules
- Interacts with live operational data
- Uses dashboards and reports
- Triggers workflow actions
- Generates system events
- Consumes real-time information
- Affects operational flow and business logic

4. Real-Time Data Impact

This role directly interacts with the real-time transportation ecosystem.

Actions performed by this role can affect:

- Bus operations
- Driver assignments
- Camera monitoring
- GPS tracking
- Financial workflows
- Maintenance workflows
- AI safety alerts
- Passenger information systems

Because the platform is interconnected, actions performed by one role automatically affect other departments and operational flows.

5. Important Developer Considerations

- Role-based access control (RBAC) is critical
- Permissions must be modular and scalable
- Realtime updates are required
- Audit logs should track all actions
- Cross-department workflow integration is necessary
- Dashboard views should differ by role
- Notification systems should be role-aware
- Operational events should be linked across modules

6. Final Assessment

The Operations Manager role is a critical part of the SEUM intelligent transportation ecosystem.

This role interacts not only with traditional ERP workflows, but also with:

- Real-time transportation operations
- AI safety systems
- GPS tracking infrastructure
- Smart bus devices
- Live camera monitoring
- Financial and operational analytics

The system must therefore be designed with interconnected workflows and scalable permission architecture.
